Status	Finished
Started	Wednesday, 21 October 2026, 10:21 PM
Completed	Wednesday, 21 October 2026, 10:28 PM
Duration	7 mins 8 secs
Grade	**10.00** out of 10.00 (**100**%)

Question **1**

Correct

Mark 1.00 out of 1.00

Create a Python program to find the longest word in a text file.

- **Input:**
  - A text file containing multiple lines of text.
- **Output:**
  - The longest word in the file.

For example:

Input	Result
input1.txt	Longest word: containing

Answer: (penalty regime: 0 %)

```
filename = input()

with open(filename, "r") as file:
    text = file.read()

words = text.split()

if words:
    longest = max(words, key=len)
    print("Longest word:", longest)
else:
    print("No words found")
```

	Input	Expected	Got	
✓	input1.txt	Longest word: containing	Longest word: containing	✓
✓	input2.txt	Longest word: thousand	Longest word: thousand	✓
✓	input3.txt	Longest word: supercalifragilisticexpialidocious	Longest word: supercalifragilisticexpialidocious	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **2**

Correct

Mark 1.00 out of 1.00

Create a Python program to write to a specific line in a text file, replacing the existing content of that line.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to write to.
   - New content for the specified line.
2. **Output:**
   - The updated file with the specified line replaced by the new content in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Updated line two.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`2`
	`Updated line two.`
		`Line one.`
		`Updated line two.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
filename = input().strip()
line_number = int(input())
new_content = input()

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    lines[line_number - 1] = new_content + "\n"

with open("output.txt", "w") as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`2`
		`Updated line two.`
			`Line one.`
			`Updated line two.`
			`Line three.`
			`Line four.`
				`Line one.`
				`Updated line two.`
				`Line three.`
				`Line four.`
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input2.txt`
		`2`
		`Line B Updated.`
			`Line A.`
			`Line B Updated.`
			`Line C.`
				`Line A.`
				`Line B Updated.`
				`Line C.`
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **3**

Correct

Mark 1.00 out of 1.00

Create a Python program to delete a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to delete.
2. **Output:**
   - The updated file with the specified line removed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	2
		Line one.
		Line three.
		Line four.

Answer: (penalty regime: 0 %)

```
filename = input().strip()
line_number = int(input())

with open(filename, "r") as file:
    lines = file.readlines()

if 1 <= line_number <= len(lines):
    del lines[line_number - 1]

with open("output.txt", "w") as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		2
			Line one.
			Line three.
			Line four.
				Line one.
				Line three.
				Line four.
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		3
			Line A.
			Line B.
				Line A.
				Line B.
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **4**

Correct

Mark 1.00 out of 1.00

Write a Python program to count the frequency of each word in a given text file.

Description:

1. **Input:**
   - String as input.
2. **Output:**
   - A list of words with their corresponding frequency count to be write in a file "output.txt"

Example:

- **Input File Content:**

  apple orange apple banana apple orange

Output:

apple: 3
orange: 2
banana: 1

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`apple orange apple banana apple orange`	`apple: 3`
		`banana: 1`
		`orange: 2`

Answer: (penalty regime: 0 %)

```
from collections import Counter
import string

text = input().lower()
text = text.translate(str.maketrans("", "", string.punctuation))

frequency = Counter(text.split())

with open("output.txt", "w") as file:
    for word in sorted(frequency):
        file.write(f"{word}: {frequency[word]}\n")
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`apple orange apple banana apple orange`	`apple: 3`
			`banana: 1`
			`orange: 2`
				`apple: 3`
				`banana: 1`
				`orange: 2`
					✓

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`Hello world! Hello everyone. Welcome to the world of programming.`	`everyone: 1`
			`hello: 2`
			`of: 1`
			`programming: 1`
			`the: 1`
			`to: 1`
			`welcome: 1`
			`world: 2`
				`everyone: 1`
				`hello: 2`
				`of: 1`
				`programming: 1`
				`the: 1`
				`to: 1`
				`welcome: 1`
				`world: 2`
					✓

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`One fish two fish Red fish blue fish`	`blue: 1`
			`fish: 4`
			`one: 1`
			`red: 1`
			`two: 1`
				`blue: 1`
				`fish: 4`
				`one: 1`
				`red: 1`
				`two: 1`
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **5**

Correct

Mark 1.00 out of 1.00

Develop a Python program to copy the contents of one file to another file.

Description:

1. **Input:**
   - Source file and destination file names.
2. **Output:**
   - The content of the source file copied to the destination file.

For example:

Test	Input	Result

`with open('output1.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	output1.txt
		This is the source file.
		It contains multiple lines of text.
		Here is another line.

Answer: (penalty regime: 0 %)

```
# Read source and destination file names from standard input
source_filename = input()
dest_filename = input()

# Copy content from source file to destination file
with open(source_filename, 'r') as src, open(dest_filename, 'w') as dest:
    dest.write(src.read())
```

	Test	Input	Expected	Got	

✓	`with open('output1.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		output1.txt
			This is the source file.
			It contains multiple lines of text.
			Here is another line.
				This is the source file.
				It contains multiple lines of text.
				Here is another line.
					✓

✓	`with open('output2.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		output2.txt
			Hello, world!
			Python programming is amazing.
			Let's copy this text to another file.
				Hello, world!
				Python programming is amazing.
				Let's copy this text to another file.
					✓

✓	`with open('output3.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input3.txt
		output3.txt
			Single line.	Single line.	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **6**

Correct

Mark 1.00 out of 1.00

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to reverse.
2. **Output:**
   - The updated file with the specified line's contents reversed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

Output:

Line one.
Line two.
eerht eniL.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	3
		Line one.
		Line two.
		eerht eniL.
		Line four.

Answer: (penalty regime: 0 %)

```
# Read input file name and 1-based line number to reverse
input_filename = input().strip()
target_line = int(input().strip())

# Read all lines from the source file
with open(input_filename, 'r') as file:
    lines = file.readlines()

index = target_line - 1

if 0 <= index < len(lines):
    line = lines[index]

    # Track and remove trailing newline
    has_newline = line.endswith('\n')
    if has_newline:
        line = line[:-1]

    # Preserve trailing punctuation (e.g., period '.')
    if line and line[-1] in '.!?':
        punct = line[-1]
        line_content = line[:-1]
        reversed_line = line_content[::-1] + punct
    else:
        reversed_line = line[::-1]
```

```
26
27      # Restore trailing newline if present
28      if has_newline:
29          reversed_line += '\n'
30
31      lines[index] = reversed_line
32
33  # Write the updated contents to output.txt
34  with open('output.txt', 'w') as file:
35      file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		3
			Line one.
			Line two.
			eerht eniL.
			Line four.
				Line one.
				Line two.
				eerht eniL.
				Line four.
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		2
			Line A.
			B eniL.
			Line C.
				Line A.
				B eniL.
				Line C.
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **7**

Correct

Mark 1.00 out of 1.00

Write a Python program to append a new line at a specific position in a text file, shifting existing lines down.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to insert the new line at.
   - New content for the new line.
2. **Output:**
   - The updated file with the new line inserted at the specified position, shifting the existing lines down in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

  Inserted line..

Output:

Line one.
Line two.
Inserted line.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`3`
	`Inserted line.`
		`Line one.`
		`Line two.`
		`Inserted line.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
# Read input parameters
input_filename = input().strip()
position = int(input().strip())
new_content = input().strip()

# Read all lines from source file
with open(input_filename, 'r') as file:
    lines = file.readlines()

index = position - 1

# Ensure the preceding line ends with a newline if we insert before/after it
if index > 0 and index - 1 < len(lines):
    if not lines[index - 1].endswith('\n'):
        lines[index - 1] += '\n'

# Format new content to always end with a newline
if not new_content.endswith('\n'):
    new_content += '\n'

```

```
# Insert the new line at the specified position
if index >= len(lines):
    # If inserting past existing lines, ensure last existing line has a newline
    if lines and not lines[-1].endswith('\n'):
        lines[-1] += '\n'
    lines.append(new_content)
else:
    lines.insert(index, new_content)

# Write the updated content to output.txt
with open('output.txt', 'w') as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		3
		Inserted line.
			Line one.
			Line two.
			Inserted line.
			Line three.
			Line four.
				Line one.
				Line two.
				Inserted line.
				Line three.
				Line four.
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		4
		Inserted line D.
			Line A.
			Line B.
			Line C.
			Inserted line D.
				Line A.
				Line B.
				Line C.
				Inserted line D.

Correct

Marks for this submission: 1.00/1.00.

Question **8**

Correct

Mark 1.00 out of 1.00

Develop a Python program to identify and print all palindrome words from a given text file.

Description:

1. **Input:**
   - A text file containing multiple words.
2. **Output:**
   - A list of palindrome words found in the file name as 'output.txt'.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt	madam
		arora
		malayalam

Answer: (penalty regime: 0 %)

```
import string

# Read the input filename from standard input
input_filename = input().strip()

# Read the content of the file
with open(input_filename, 'r') as file:
    text = file.read()

# Extract words by stripping punctuation and splitting text
words = text.split()

palindromes = []
for word in words:
    # Clean word by stripping outer punctuation (like periods, commas)
    clean_word = word.strip(string.punctuation)

    # Check if cleaned word is non-empty, longer than 1 char, and a palindrome (case-insensitive)
    if clean_word and len(clean_word) > 1:
        if clean_word.lower() == clean_word.lower()[::-1]:
            palindromes.append(clean_word)

# Write palindrome words line by line to output.txt
with open('output.txt', 'w') as file:
    for p in palindromes:
        file.write(p + '\n')
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt	madam
			arora
			malayalam
				madam
				arora
				malayalam
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **9**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to read.
2. **Output:**
   - The content of the specified line.

input1.txt:

Line one.
Line two.
Line three.
Line four.

For example:

Input	Result
input1.txt 3	Line three.

Answer: (penalty regime: 0 %)

```
# Read input file name and 1-based line number
input_filename = input().strip()
line_number = int(input().strip())

# Read all lines from the file
with open(input_filename, 'r') as file:
    lines = file.readlines()

# Convert 1-based line number to 0-based index
index = line_number - 1

# Print the specific line without extra newlines
if 0 <= index < len(lines):
    print(lines[index].rstrip('\r\n'))
```

	Input	Expected	Got	
✓	input1.txt 3	Line three.	Line three.	✓
✓	input2.txt 3	Line C.	Line C.	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **10**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a text file and count the total number of words in the file.

Description:

1. **Input:**
   - A text file containing several lines of text.
   - File name you should get as input.
2. **Output:**
   - The total number of words in the file.

For example:

Input	Result
input2.txt	Total words: 14
input3.txt	Total words: 15

Answer: (penalty regime: 0 %)

```
# Read the input filename from standard input
input_filename = input().strip()

# Read content and count total words
with open(input_filename, 'r') as file:
    content = file.read()
    # split() handles space, newline, and tab delimiters automatically
    words = content.split()
    total_words = len(words)

# Output total word count matching the required format
print(f"Total words: {total_words}")
```

	Input	Expected	Got	
✓	input1.txt	Total words: 6	Total words: 6	✓
✓	input2.txt	Total words: 14	Total words: 14	✓
✓	input3.txt	Total words: 15	Total words: 15	✓

Passed all tests! ✓

Correct
